How to cite GALILEO in your research paper:

An Article from an Electronic Subscription Service

When citing material accessed via an electronic subscription service (e.g., a database or online collection your library subscribes to), cite the relevant publication information as you would for a periodical (author, article title, periodical title, and volume, date, and page number information) followed by the name of the database or subscription collection, the name of the library through which you accessed the content, including the library's city and state, plus date of access. If a URL is available for the home page of the service, include it. Do not include a URL to the article itself, because it is not openly accessible. For example:

Info you list, in order:
1. author’s name
2. article title
3. periodical name
4. publication date
5. page number/range
6. database name - Literary Reference Center
7. service name – GALILEO
8. name of school’s library
9. name of city where accessed
10.date of access
11.URL for GALILEO
How to find an article in GALILEO to use in your paper…

What is GALILEO?
A collection of databases accessible to any school or library in Georgia. It is used for research in any subject area. It stands for Georgia Library Learning Online. Other states have their own versions of GALILEO too.

Why do I need this if I can just Google for information on my topic?
GALILEO houses articles from journals that are by subscription only, so most of the articles are not available on the general internet. Plus, it is more reliable because it is a state-sponsored website with educational content.

Why is GALILEO so confusing?
I know, right? It’s because it has way too much information. The trick is to limit the databases you search from.

How do I do that?
Every subject area has a particular database that works well. For example, for English papers, we will use a database called the Literary Reference Center. It only has articles relevant to literature.

1. To get started, go to the school’s web page, and click on Media Center.
2. Click on General Resources on the left.
3. Click on the link to GALILEO.
4. Click on Databases A-Z, and click the letter “L.”
5. Click on the Literary Reference Center.
6. Now you’re ready to research.

Use the search engine as you would use Google. Type in key words about your topic to get a list of related articles. Always check the “full text” box so you only get a list of articles that are short enough to be on the web site. Otherwise, you may see books that we don’t have access to.

When you click on an article, you should see a summary of it first. Read this to see if it is way off-base from what you are looking for.

Basically, you are looking for an article where the writer has made an observation about your main idea, and his or her observation is similar to your own. This supports your position because the article writer is a professional, credible source (which is why we NEVER use Wikipedia in a research paper.)

See my sample paper for an example of how to include a supporting argument from your source.
